

My Life Planner

Developer Handbook - v51 baseline

Blue Zebra 77

1. Release model

Public releases use whole numbers. Lettered suffixes are internal test milestones only. The accepted v51f Settings-corrected source was normalised into the v51 production release.

2. Release gate

- JavaScript syntax check
- Manifest JSON validation
- Duplicate HTML ID scan
- CSS brace balance
- Version audit across header, About, JavaScript, manifest, service worker, cache and documentation
- Required-file audit and ZIP integrity check
- Data-retention and regression checklist

3. Data architecture

The authoritative browser key is lifePlannerData. The migration framework stores schema information, creates pre-migration safety copies, validates core collections and records diagnostics. Today's Focus has an additional safety mirror. Do not rename established keys without a formal migration.

4. Design rules

- One logical home per item.
- Views may aggregate but must not duplicate data.
- Home prioritises what matters now.
- Explanations appear on demand.
- Suggestions are calm, snoozable and dismissible.
- Prefer simplification over another screen when capability already exists.

5. Development workflow

- Start from the latest accepted source package.
- Lock a small milestone scope.

- Implement and perform static checks.
- Package a checklist with every test build.
- Use real-life data for acceptance testing.
- Correct regressions before starting another feature milestone.
- Only accepted builds become a baseline.

6. Version audit locations

- Header version
- About version and recent changes
- APP_VERSION constant
- manifest name, start_url and version
- service-worker cache and asset query strings
- Developer Dashboard output
- README, release notes, build report and test checklist
- ZIP filename

7. Mobile considerations

- Respect iPhone safe-area insets.
- Keep fixed controls clear of bottom navigation and minimised timer.
- Reserve row width for three-dot actions.
- Recalculate fixed-control offsets on resize and orientation change.
- Use 16px or larger form text to avoid iOS zoom.

8. Future work

See ROADMAP_v52.md. Future work should be prioritised from real use, with the progress bar and Home/Timeline distinction kept under review.
